Henderson Mountain Observations

Date
Wed, 02/07/2024 - 15:30
Activity
Skiing

From email: "My friend and I toured in Cooke City today. We skied the low angle glades on the South side of Henderson Mountain. Breaking trail, we experienced at least 20 collapses, several of which were large enough to knock snow off the trees around us. Above 9200’ where the snowpack started to deepen, we did not get any collapses or cracking. We dug a quick pit at 9750’ on a SSE aspect. The site we dug on had been wind loaded substantially before the high pressure cycle last week. Skies were mostly cloudy with the sun poking out occasionally, light winds out of the west. Our ECT did not have propagation, but the results from our CT test were poor. Given the sketchy conditions, we stuck to low angle terrain."

Region
Cooke City
Location (from list)
Henderson Mountain
Observer Name
Nicholas Salsburg
