

Divide pk east shoulder

Date

Sat, 01/02/2021 - 17:07

Activity

Snowboarding

I toured up to divide today and ascended the lower east shoulder of divide pk

There were no obvious signs of instability so I ascended the Low angle terrain to the north east of the pk

I dug 2 pits on my ascent one propagated at the ectp17 and the other at ectp25

From these results I keep off any of the small roll overs or steeper pitches of that east flank of the pk and just road the 30 deg terrain to far lookers right of the pk

I was up there two weeks ago And would not ski due to instabilities but the stability is improving but still can not be trusted

Yesterday I saw two tracks center punching directly off divide pk

I feel that person was totally rolling the dice

I did not ascent any slopes that were connected to steep terrain and keep the angle at 30 deg

The snowpack in hyalite can not be Trusted

Region

Northern Gallatin

Location (from list)

Hyalite - main fork

Observer Name

Tyler
