

Fairy Lake in the Sacajawea bowl

Date

Thu, 11/11/2021 - 11:58

Activity

Skiing

Dug a snow pit at 8,280ft adjacent to a chute. It was NW aspect. We found a ~35cm 1 finger windslab sitting on top of a ~25cm knife hard slab. We got ICT 12 on the first slab and ICT 15 on the deeper slab. On the ECT, we got a slight fracture at 15 taps and a full fracture at 17 (ECTP+2). This layer seemed to be on all aspects we looked at above tree line on NW faces. Bellow treeline, the snowpack was shallower and seem to lack these slabs.

Region

Bridger Range

Location (from list)

Fairy Lake

Observer Name

Jackson Krause
