

From obs. 4/7/23: "I went through the area of Three Rivers Peak yesterday, and there had been a pretty nice cycle of large slides recently. One on the east face of Three Rivers broke 6-800' wide 2-10'+ deep, and ran full track. It only had a couple inches of snow on it, so I think it ran sometime during the recent warm days. Some of the walls along the slide were over 20' high, and I imagine the debris pile might make it through the summer. I also observed a couple older slides on  $E\setminus NE$  aspects that were older, but not a whole lot smaller." Photo: S. Reinsel
